Activity 1.3 – Set Up the Development Environment

Slide 1: Title

Activity 1.3: Set Up the Development Environment

- Setting up the tools required for software development
 - Installing the necessary software and configuring the workspace
 - Ensuring the system is ready for coding and testing
-

Slide 2: What is a Development Environment?

A **development environment** is a collection of tools used to create, test, and debug software applications.

Main components:

- Operating System
- Code Editor / IDE
- Programming Language
- Compiler or Interpreter
- Version Control System
- Required libraries and packages

Slide 3: Installing the Required Tools

Steps:

1. Check the system requirements.
2. Install the required programming language.
3. Install a suitable code editor or IDE.
4. Install necessary libraries and dependencies.
5. Install Git for version control.
6. Restart the system if required.

Examples:

- Visual Studio Code – Code Editor
 - Python / Java / Node.js – Programming Environment
 - Git – Version Control
-

Slide 4: Configuring the Environment

Configuration steps:

- Create a project folder.
- Configure the IDE or code editor.
- Set the required environment variables.
- Install project dependencies.
- Configure Git and initialize the repository.
- Create and run a simple test program.

Example:

Project Folder

```
|  
├── src/  
├── tests/  
├── README.md  
└── requirements/dependencies
```

Slide 5: Testing the Development Environment

Verification:

- Open the code editor.
- Create a simple program.
- Run the program successfully.
- Check for errors or missing dependencies.
- Test debugging and terminal functionality.
- Confirm that Git is working correctly.

Conclusion:

The development environment is successfully configured and ready for application development.
